

Technical Assesment: Change Tools

As the next step, we would like you to complete a small technical challenge.

The task is to build a lightweight agentic AI workflow for a ChangeTools-style use case.

ChangeTools helps organisations streamline change strategy, communication, and performance measurement using AI-powered systems.

For this challenge, imagine a company uploads internal change programme materials, and your system needs to transform that data into a structured Change Strategy Brief and a slide deck version of it.

The user should also be able to interact with the system through a chat interface.

The agent should prompt the user to upload branding elements such as:

- Logo
- Font
- Colour palette

The generated outputs should reflect this branding.

What we would like you to build

- A Python-based agentic AI workflow
- Ideally using the LangChain ecosystem
- Ingest a small set of company documents
- Build a simple RAG/retrieval layer
- Include source evidence for key claims
- Include a validation step to reduce hallucinations
- Include basic evaluation cases
- Include basic tracing or observability

Model requirements:

- You should either use an open-source model directly in the prototype (e.g. via Ollama, vLLM, Hugging Face, or a local model server), or clearly design the system so it can use an open-source model in production
- If you use a lightweight local model, explain what you would change for a production setup

Data requirements:

- Use a database to store ingested company data, generated outputs, timestamps, and processing status

The deadline is the 5th of May to submit your solution, but the task is designed to be achievable in one focused working day using AI-assisted development tools.

We are not looking for perfection. We are looking for:

- Clear agent design
- Strong technical judgement
- Practical use of RAG
- Structured, reliable outputs
- Thoughtful evaluation
- Awareness of hallucination risks

Please submit

- GitHub repository link
- README with setup instructions
- Example generated output
- Evaluation report
- Live deployed API URL

Bonus points

- Use of LangSmith or another tracing/observability tool

Please find the input attached.

This contains a set of documents representing internal company information from Obsidian Group, a mid-sized organisation undergoing a transformation programme.

These documents simulate the type of unstructured and semi-structured data that ChangeTools systems typically process. The input includes:

1. AI Call Notes (Word Document)

This document represents notes automatically generated from an internal stakeholder call.

It contains:

- Discussion points from leadership and operational teams
- Concerns raised by different stakeholders
- Early signals of risks and resistance
- Informal and sometimes ambiguous language

2. Change Data Pack (Excel File)

This document represents operational and performance data related to the transformation.

It includes:

- KPI tracking and targets
- Regional performance data
- Adoption metrics
- Operational indicators

Your system is expected to:

- Ingest multiple formats (unstructured and structured)
- Extract relevant information
- Combine insights across sources
- Handle inconsistencies or missing context

You should assume:

- The data may be incomplete or partially inconsistent
- Not all documents carry equal weight or reliability
- Some insights must be inferred by combining multiple sources
- Certain claims should be validated against available evidence

Using this input, your system should generate a structured Change Strategy Brief that:

- Reflects the company's transformation programme
- Identifies key risks and challenges
- Analyses stakeholder concerns
- Surfaces relevant KPIs and performance signals
- Recommends actionable next steps
- Clearly indicates confidence and supporting evidence

It should also generate a **slide deck counterpart**. Both the brief and the slide deck should reflect the design of the company and contain its logo.
